

Joinery in record time thanks to comprehensive roof assistants

Generate roof trusses easily and quickly thanks to the integrated assistant for profile input and roof centring as well as for dormer windows, skylights and chimneys with automatic change function. In the three-dimensional real-time preview you can visually track each adaptation in the roof input without time delay.

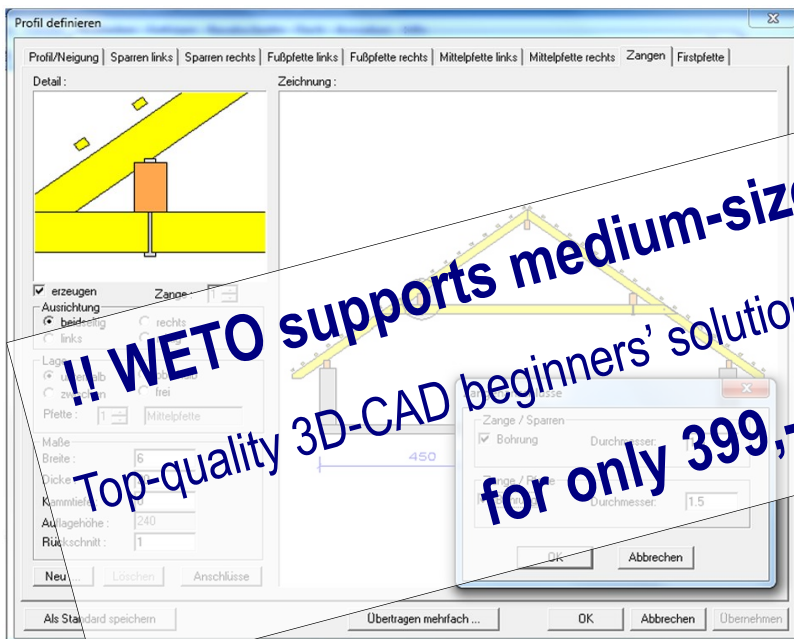

Benefit from the processing options for unfinished, finished and insulated roof areas as well as from the integrated timber and rafter lists with the possibility to filter according to construction components and to determine the list sorting order yourself. 2D individual wood and profile drawings for your production planning are created with automatic dimensioning and lettering.

Excellent ease of use

LigniKon^{Small} convinces by its clearly structured interface, which reflects the classical design of wooden constructions. Clearly structured dialogues and practice-oriented functions such as material pre-settings, a simplified window management for the representation of all opened windows at once as well as a comprehensive mouse assignment enable the best possible ease of use. Work directly in 3D with the intuitively operable WETO software.

Save time and money with the easy joinery programme!
